                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    by altering its transcription or translation. It is reduced e.g. by sense suppression, antisense suppression, homologous recombination, the use of ribozymes, dominant-negative mutants, aptamers, zinc inger proteins, double-stranded RNA, or insertional, point or deletion mutagenesis, and increased by overexpression. The methods are useful for altering or stabilizing the expression of a nucleotide sequence of interest in a plant cell or plant. Suppressing or decreasing expression of the nucleic acid molecule results in decreased levels of post transcriptional gene silencing and improved expression of genes of interest. The 3'.5' exonuclease domain polypeptides are also useful for identifying compounds capable of altering 3'.5' exonuclease activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             identified using different screening methods and search algorithms. The invention encompasses the suppression or increase of gene silencing in plants. This is achieved by altering the expression in the plant cell of a nucleotide sequence encoding a polypeptide, such as the present sequence, having an exonuclease domain, preferably a 3'-5' exonuclease domain, and especially an RNase D related domain. Expression of the nucleotide sequence is altered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present is that of an Arabidopsis thaliana 3'-5' exonuclease domain, specifically an RNase D related domain. The 3'-5' exonuclease domain consists of 3 sequence motifs termed ExoI, Exand ExoIII. It was identified on the basis of homology to the Arabidopsis 3'-5' exonuclease sequence given in AAM50927. The nucleotide (see ABA91795-807) and polypeptide (see ABA927-39) sequences for 3'-5' exonuclease domains of the invention were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Regulating gene expression in plants for controlling gene silencing, comprises altering the transcription or translation of an endonuclease nucleotide sequence encoding a polypeptide comprising an exonuclease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Levin JZ,

     밁
CC domain (Genrept accession CAB3681), specifically an RNase D related CC domain. The 3'-5' exonuclease domain consists of 3 sequence motifs CC domain. The 3'-5' exonuclease domain consists of 3 sequence motifs CC domains were identified using different screening methods and search CC algorithms. The invention encompasses the suppression or increase CC expression in the plant cell of a nucleotide sequence encoding a CC polypeptide, such as the present sequence, having an exonuclease CC expression in the plant cell of a nucleotide sequence encoding a CC polypeptide, such as the present sequence, having an exonuclease CC an RNase D related domain. Expression of the nucleotide sequence is altered by altering its transcription or translation. It is reduced e.g. by sense suppression, antisense suppression, homologous creduced e.g. by sense suppression, antisense suppression. CC recombination, the use of ribozymes, dominant-negative mutants, CC point or deletion mutagenesis, and increased by overexpression of the methods are useful for altering or stabilizing the expression of a nucleotide sequence of interest in a plant cell or plant. Suppressing or decreasing expression of the nucleic acid molecule cresults in decreased levels of post transcriptional gene silencing
                                                                                                                                                                                                                                                                                                                                                          Regulating gene expression in plants for controlling gene silencing, comprises altering the transcription or translation of an endonuclease nucleotide sequence encoding a polypeptide comprising an exonuclease
                                                                                                                                                                                                                                                                                                                      Claim

The products can be used for the detection and treatment of Werner's syndrome (WS), an autosomal recessive disorder with a complex phenotype, as well as related diseases.

                                                                                                                                                                                                                                                                                                                                              c of gene silencing in plants. This is achieved by altering the expression in the plant cell of a nucleotide sequence encoding a polypeptide, such as the present sequence, having an exonuclease domain, preferably a 3'-5' exonuclease domain, and especially an RNase D related domain. Expression of the nucleotide sequence is altered by altering its transcription or translation. It is reduced e.g. by sense suppression, antisense suppression, homologous reduced e.g. by sense roteins, double-stranded RNA, or insertional, point or deletion mutagenesis, and increased by overexpression of a nucleotide sequence of interest in a plant cell or plant. Suppressing or decreasing expression of the nucleic acid molecule results in decreased levels of post transcriptional gene silencing and improved expression of genes of interest. The 3'-5' exonuclease domain polypeptides are also useful for identifying compounds capable of altering 3'-5' exonuclease activity.
                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EXOI, EXOII and EXOIII. Nucleotide (see ABA91795-807) and polypeptide (see ABM50927-39) sequences for 3'-5' exonuclease domains were identified using different screening methods and search algorithms. The invention encompasses the suppression or increase of gene silencing in plants. This is achieved by alternative transfer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present is that of human Werner syndrome protein (GenPept accession AAF06162), which includes an N-terminal 3'-5' exonuclease domain. The protein was identified in a homology screening with an Arabidopsis thaliana 3'-5' exonuclease domain (see AAM50927). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Regulating gene expression in plants for controlling gene silencing, comprises altering the transcription or translation of an endonuclease nucleotide sequence encoding a polypeptide comprising an exonuclease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (SYGN)

                                                                                                                                                                                                                                                                                В
                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                    Ş
                                                                                                                                                                                                                                                                                                                                                                                                         This is the amino acid sequence of a polypeptide encoded by mWRN case AAX24302), the murine homologue of the human WRN gene associated with Werner's syndrome. A claimed assay for identifying a compound which extends life span comprises administering a compound to be tested to a mammal with a suppressed level of mWRN, and identifying slowing of at least one of the normal phenotypes of ageing in the mammal. A compound identified by this method inhibits the replication and/or accumulation of rDNA circles in a cell. The assay can be performed using a mWRN knockout mouse (also claimed). The mucleic acids can be used to produce mWRN polypeptides and as diagnostic probes and primers. mWRN polypeptides can be used to raise antibodies (for inhibiting activity of mWRN or for determining it is in tissues). The assay is based on the observation that in yeast cells, accumulation of ribosomal circular DNA is responsible for age-related enlargement and fragmentation of the nucleolus. A mutation in the yeast WRN homologue SGS1 causes premature ageing, suggesting a common ageing mechanism in all eukaryotes. Insight into the ageing process in model systems can provide insight into
                                                                                                                                                                                                                                                                                                                              Matches

The corresponding human gene product (AAY14517) is associated with Werner's syndrome. The products can be used for the detection and treatment of Werner's syndrome (WS), an autosomal recessive disorder with a complex phenotype,
